The `docref` Package

Amer Amikhteh

Version 0.2
October 26, 2026

`docref` retrieves reference numbers, titles, and page numbers from locally available package documentation. It requires LuaLaTeX. Keep `docref.sty` and `docref.lua` together beside your document or in a TeX-searchable directory.

1 Usage

Each command takes a package name and a label. `\docref{pkg}{label}` gives the reference number, `\docnameref{pkg}{label}` the title or caption, and `\docpageref{pkg}{label}` the page number.

For example, refer to a section in the Babel manual:

```
\usepackage{docref}
\usepackage{hyperref} % optional

See Section~\docref{babel}{selectors},
``\docnameref{babel}{selectors}'',
on page~\docpageref{babel}{selectors}.
```

This refers to Babel section 1.9, "Basic language selectors", on page 19.

The same commands work for figures. This example uses the supplied label record from the `geometry` 6.0 manual:

```
\DocRefSource{geometry}{geometry-labels.aux}[geometry.pdf]

Figure~\docref{geometry}{fig:Labc},
``\docnameref{geometry}{fig:Labc}'',
on page~\docpageref{geometry}{fig:Labc}.
```

This refers to Figure 3, "A simple model of page dimensions", on page 4.

With hyperref, loaded before or after `docref`, references link to the external PDF. All three commands accept a star to suppress the link, for example `\docref*{geometry}{fig:Labc}`. Unresolved values produce `??` and a warning. Dotted number components follow the surrounding text direction; digits within each component remain left to right.

2 Selecting a manual

Common source names include `pkg.tex`, `pkg-doc.tex`, and `pkg-manual.tex`; `.ltx` and `.dtx` sources are also supported. Installed documentation takes precedence over similarly named files in the working directory.

Register a source or auxiliary file explicitly in the preamble:

```
\DocRefSource{pkg}{path/manual.tex}[path/manual.pdf]
```

The optional final argument selects a PDF file or URL. Otherwise the PDF is sought beside the source and in TeX's documentation search path. A fragment's `% !TeX root = manual.tex` comment selects its main document. An auxiliary file can be registered without the TeX source.

3 Labels and lookup rules

For complete references, make the built manual's `.aux` file available. Its records supply numbers, titles, pages, and destinations for all label types, including chapters, figures, tables, equations, list items, and custom counters.

Titles require records produced with nameref or hyperref; exact link destinations require hyperref in the target manual. Titles are plain text; recorded empty values remain empty. Auxiliary files, including those for included chapters, are read as data.

Source scanning alone handles headings from `section` to `subparagraph`, with labels following their headings. It cannot calculate arbitrary counters or pagination. PDF bookmarks and page labels provide fallback titles and pages; physical page numbers are used when page labels are absent.

Without an auxiliary destination, a standard section destination is used only if it exists in the PDF; otherwise the link opens the manual at its beginning. If no PDF is found, the reference remains unlinked.

4 License

The `Docref` package is released under the LaTeX Project Public License (LPPL), version 1.3c or later. The full text of the license is available in the `LICENSE` file.

5 Author and Maintainer

The `Docref` package is developed and maintained by **Amer Amikhteh**.

The project's source code, development versions, and issue tracker are available in the project repository:
